

Central Management Software for Clarity Systems

Models: Clarity™

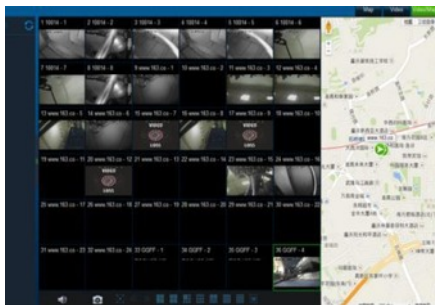

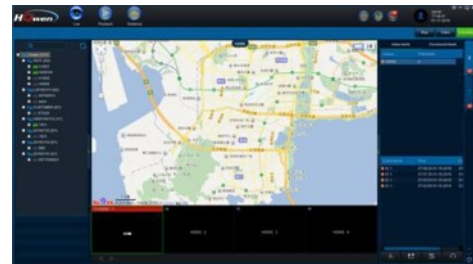

The **RTI CMS Platform** is based on wireless networking, with high-quality, high-efficiency transmission of video, audio, data and other network-based multimedia information. It is designed for centralized management, monitoring and dispatching for all types of vehicles.

Main Functions

- 3G/LTE/Wifi network live view
- Displays the vehicle, GPS, alarm, log information clearly
- PTZ control and MDVR remote configuration
- Remote record
- Supports download and playback video file
- Vehicle management
- Database supported and GPS route playback
- Supports to export the report
- Different user level management
- Driver behavior analysis
- Alarm management and evidence reporting

Open and flexible platform

RTI CMS has a modularized software structure-- open for more enhanced features/applications. The software can be compatible with third-party systems.

Intelligent & service-oriented application

RTI CMS is an intelligent and comprehensive platform based on video monitoring, GPS, alarm, and other info. With Remote Live Viewing & Real time Tracking, on-board **Clarity™** DVRs can upload data to a centralized server. We provide client software and a web client page for remote viewing, real time location tracking, to display vehicle status and device information, etc.

Besides video and GPS info display, **RTI CMS** provides intelligent service-oriented applications for emergency management and driver behavior analysis for operation and management.

Evidence Center

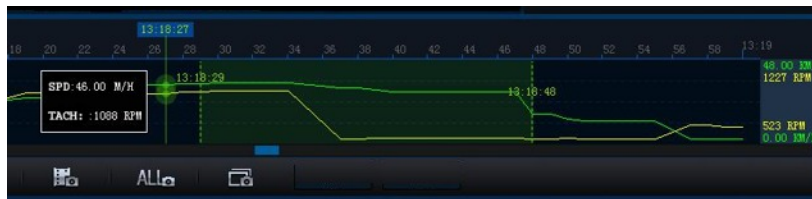

RTI CMS has an advanced “Evidence Center” function module. In this module, the software can intelligently sort out the videos uploaded, and users can slice the video into snapshots, then mark them with GPS info (GPS location map snapshot), driver ID, time, evidence name and description.

The software can intelligently generate an alarm/emergency report automatically, for easy retrieval for operator and fleet management.

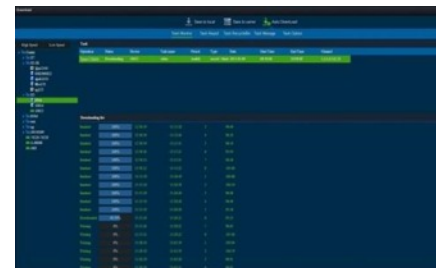

Driver Behavior Analysis

RTI CMS supports inputting the vehicle’s Meta Data, and analyzing the driver’s behavior using the data and video, GPS info, speed, engine speed, etc. This analysis can provide evidence for operators to evaluate employees’ performance and improve companies’ fleet management.

Auto Uploading & Advanced Wi-Fi solution

On-board **Clarity™** can upload the video record triggered by a specified event, alarm or requested by client to data center automatically via Wi-Fi or 3G/4G. The system can automatically continue transmitting after reconnection, in case of a connection failure.

Various terminals for operation:

- Client software operation
- Mobile client APP (Android/IOS)
- Server software configuration

Auto Event Push

When **Clarity™** receives an alarm, it will push that information to the data center immediately. In addition, the **CMS** can automatically upload the alarm video to back office server, and generate evidence and alarm report immediately--saving important data when accidents happen.
